

Today 10:36 AM

I need help debugging this code because when i click on the toggles, the tasks visible don't update.

```
const [archiveFilter, setArchiveFilter] = useState<"active" | "archived" | "all">("active");
const filteredTodos = useMemo(() => {
  return todos.filter((task) => {
    const matchesSearch = task.title
      .toLowerCase()
      .includes(search.toLowerCase());
```

Show more ▾

The most likely issue is that your `useMemo` is **not re-running when** `archiveFilter` changes.

Right now your dependency array is:

```
<> TypeScript

[
  todos,
  search,
  topicFilter,
  statusFilter,
  dateFilter
]
```

But the memoized calculation also uses `archiveFilter`, so React keeps returning the previous `filteredTodos` value when you click the toggle buttons.

Add `archiveFilter` to the dependency array:

```
<> TypeScript
```

```

const filteredTodos = useMemo(() => {
  return todos.filter((task) => {
    const matchesSearch = task.title
      .toLowerCase()
      .includes(search.toLowerCase());

    const matchesTopic =
      topicFilter === "All Topics" || task.topic === topicFilter;

    const matchesStatus =
      statusFilter === "All Statuses" || task.status === statusFilter;

    const matchesDate =
      !dateFilter ||
      (task.dueDate && task.dueDate.slice(0, 10) === dateFilter);

    const matchesArchive =
      archiveFilter === "all" ||
      (archiveFilter === "active" && !task.archived) ||
      (archiveFilter === "archived" && task.archived);

    return (
      matchesSearch &&
      matchesTopic &&
      matchesStatus &&
      matchesDate &&
      matchesArchive
    );
  });
}, [
  todos,
  search,
  topicFilter,
  statusFilter,
  dateFilter,
  archiveFilter, // <-- missing dependency
]);

```

Why this happens

`useMemo` only recalculates when one of the values in its dependency array changes. Since `archiveFilter` was omitted:

- Clicking **Active / Archived / All** updates state.
- The component re-renders.
- But `useMemo` thinks none of its dependencies changed, so it returns the old filtered array.
- The visible tasks therefore do not update.

Quick debugging tip

Add a log:

```
</> TypeScript  
console.log("archiveFilter", archiveFilter);
```

If you see the value changing in the console but the UI not updating, that is a strong sign that the filtering logic is memoized with missing dependencies.

One more thing to verify: make sure each todo actually has an `archived` boolean property. If some tasks have `archived` as `undefined`, they will be treated as active because `!undefined === true`.
